Newer devices, running Android version as it may vary. Newer devices, running Android version as it may vary. There are several types of wallpaper to choose from, you can download the one that is right for you. wallpaper HD wallpaper AK wallpaper AK wallpaper AK wallpaper and other reason than personal use? Whether it's for your website, YouTube Chanel, merchandise or any other use, the answer would be no. Usually free wallpaper websites are for personal use only Most images are protected by copyright, misusing them can lead to legal and financial repercussion. Always make sure that your images are under a Creative Commons license and that the website you are getting it from is trustworthy. For more information on how to find legal wallpapers with popular search engines you can view those tutorials: Apple is bullish on lidar, a technology that's in the iPhone 12 Pro, and Apple's iPad Pro models since 2020. Look closely at the rear camera arrays on these devices and you'll see a little black dot near the camera lenses, about the same size as the flash. That's the lidar sensor, and it delivers a new type of depth-sensing that can make a difference in photos, AR, 3D scanning and possibly even more. Read more: iPhone 12's lidar tech does more than improve photos. Check out this cool party trickIf Apple has its way, lidar is a term you'll keep hearing. It's already a factor in AR headsets and in cars. Do you need it? Maybe not. Let's break down what we know, what Apple is using it for, and where the technology could go next. And if you're curious what it does lidar mean?Lidar stands for light detection and ranging, and has been around for a while. It uses lasers to ping off objects and return to the source of the laser, measuring distance by timing the travel, or flight, of the light pulse. Trying some of the LiDAR-enabled AR apps I can find for the 2020 iPad Pro, to show meshing. Here's one called Primer, an early build to test wallpaper on walls pic.twitter.com/SatibguyTm— Scott Stein (@jetscott) April 14, 2020 How does lidar work to sense depth? Lidar is a type of time-of-flight camera. Some other smartphones measure depth with a single light pulse, whereas a smartphone with its sensor, creating a field of points that map out distances and can "mesh" the dimensions of a space and the objects in it. The light pulses are invisible to the human eye, but you could see them with a night vision camera. Isn't this like Face ID on the iPhone? It is, but with longer range. The idea's the same: Apple's Face ID on the iPhone? It is, but with longer range. on the iPad Pro and iPhone 12 Pro work at a range of up to 5 meters. pic.twitter.com/TEJTZEN0u2— Scott Stein (@jetscott) October 22, 2020 Lidar's already in a lot of other tech Lidar is a tech that's sprouting up everywhere. It's used for robotics and drones. Augmented reality headsets like the HoloLens 2 have similar tech, mapping out room spaces before layering 3D virtual objects into them. There's even a VR headset with lidar. But it also has a pretty long history. Microsoft's old depth-sensing Xbox accessory, the Kinect, was a camera that had infrared depth-scanning, too. In fact, PrimeSense, the company that helped make the Kinect tech, was acquired by Apple in 2013. Now, we have Apple's face-scanning TrueDepth and rear lidar cameras on smartphones tend to be used to improve focus accuracy and speed, and the iPhone 12 Pro did the same. Apple promises better low-light focus, up to six times faster in low-light conditions. The lidar depth-sensing is also used to improve night portrait mode effects. So far, it makes an impact: read our review of the iPhone 12 Pro Max for more. With the iPhone 13 Pro, it's a similar story: the lidar tech is the same, even if the camera technology is improved. Better focus is a plus, and there's also a chance the iPhone 12 Pro could add more 3D photo data to images, too. Although that element hasn't been laid out yet, Apple's front-facing, depth-sensing TrueDepth camera has been used in a similar way with apps, and third-party developers could dive in and develop some wild ideas. It's already happening. pic.twitter.com/rBfzWz8Gne— Scott Stein (@jetscott) October 22, 2020 It also greatly enhances augmented reality Lidar allows the iPhone and iPad Pros to start AR apps a lot more detail. A lot of Apple's core AR tech takes advantage of lidar to hide virtual objects behind real ones (called occlusion), and place virtual objects within more complicated room mappings, like on a table or chair. I've been testing it out on an Apple Arcade game, Hot Lava, which already uses lidar to scan a room and all its obstacles. I was able to place virtual objects on stairs, and have things hide behind real-life objects in the room. Expect a lot more AR apps that will start adding lidar support like this for richer experiences. Snapchat's next wave of lenses will start adopting depth-sensing using the iPhone 12 Pro's lidar. Snapchat But there's extra potential beyond that, with a longer tail. Many companies are dreaming of headsets that will blend virtual objects and real ones: AR glasses, being worked on by Facebook, Qualcomm, Snapchat, Microsoft, Magic Leap and most likely Apple and others, will rely on having advanced 3D maps of the world to layer virtual objects onto. Those 3D maps are being built now with special scanners and equipment, almost like the world-scanning version of those Google Maps cars. But there's a possibility that people's own devices could eventually help crowdsource that info, or add extra on-the-fly data. Again, AR headsets like Magic Leap and HoloLens already prescan your environment before layering things into it, and Apple's lidar-equipped AR tech works the same way. In that sense, the iPhone 12 and 13 Pro and iPad Pro are like AR headsets without the headset part... and could pave the way for Apple's first VR/AR headset, expected either this or next. For an example of how this would work, look to the high-end Varjo XR-3 headset, which uses lidar for mixed reality. A 3D room scan from Occipital's Canvas app, enabled by depth-sensing lidar on the iPad Pro. Expect the same for the iPhone 12 Pro, and maybe more. Occipital 3D scanning could be the killer app Lidar can be used to mesh out 3D objects and rooms and layer photo imagery on top, a technique called photogrammetry. That could be the next wave of capture 3D data and share that info with others could open up these lidar-equipped phones and tablets to be 3D-content capture tools. Lidar could also be used without the camera element to acquire measurements for objects and spaces. I've already tried a few early lidar-enabled 3D scanning apps on the iPhone 12 Pro with mixed success (3D Scanner App, Lidar Scanner and Record3D), but they can be used to scan objects or map out rooms with surprising speed. The 16-foot effective range of lidar's scanning is enough to reach across most rooms in my house, but in bigger outdoor spaces it takes more moving around. Again, Apple's front-facing TrueDepth camera already does similar things at closer range. Over time, it'll be interesting to see if Apple ends up putting 3D scanning features into its own camera apps, putting the tech more front-and-center. For now, 3D scanning is getting better, but remains a more niche feature for most people. Apple isn't the first to explore tech like this on a phone Google had this same idea in mind when Project Tango -- an early AR platform that was only on two phones -- was created. The advanced camera array also had infrared sensors and could map out rooms, creating 3D scans and depth maps for AR and for measuring indoor spaces. Google's Tango-equipped phones were short-lived, replaced by computer vision algorithms that have done estimated depth sensing on cameras without needing the same hardware. This time, however, lidar is already finding its way into cars, AR headsets, robotics, and much more.
